

<b>Instructor: Gabriel Thompson</b>	<b>Class: 8<sup>th</sup> Algebra 1</b>	<b>Day: 1</b>	<b>Date: TBD</b>
-------------------------------------	--	---------------	------------------

### Information about the Lesson

<b>Learning Theory</b> <input type="checkbox"/> Behaviorism <input type="checkbox"/> Cognitivism <input checked="" type="checkbox"/> Constructivism <input type="checkbox"/> Experiential	<b>Bloom's Cognitive Domain</b> <input checked="" type="checkbox"/> Remember <input checked="" type="checkbox"/> Understand <input checked="" type="checkbox"/> Apply <input type="checkbox"/> Analyze <input type="checkbox"/> Evaluate <input type="checkbox"/> Create	<b>Gardner's Multiple Intelligences</b> <input checked="" type="checkbox"/> Verbal/Linguistic <input checked="" type="checkbox"/> Logical/Mathematical <input checked="" type="checkbox"/> Visual/Spatial <input type="checkbox"/> Bodily/Kinesthetic <input type="checkbox"/> Musical/Rhythmic <input checked="" type="checkbox"/> Interpersonal/Social <input checked="" type="checkbox"/> Intrapersonal/Self-aware <input checked="" type="checkbox"/> Naturalist/Environmentally aware	<b>Lesson Type</b> <input type="checkbox"/> Present and Explain <input checked="" type="checkbox"/> Direct Instruction <input type="checkbox"/> Concept Lesson <input type="checkbox"/> Inquiry-Based Lesson <input checked="" type="checkbox"/> Cooperative Learning <input type="checkbox"/> Project /Problem-Based Learning <input type="checkbox"/> Classroom Discussion
---	--	--	---

**Previous Lesson:** Students have learned about rate of change and how it affects the way a graph looks  
**Future Lesson:** Students will discover how rate of change is slope and can be found in several different ways

**Prerequisites:** *Before beginning this lesson students will have:*

- Two lessons with practice on rate of change and how to determine it.

**Materials Needed:** TI-84 Calculators, Holt Textbook, Ruler (optional), Pencil

### Lesson Content and Design

**Central Focus / Big Idea:** Find the slope of a given line on a graph, two points, or a table

**Objective(s):**

- **SWBAT** determine the slope of a line given a graph, points, or a table.

**Guiding Question(s):**

- What is the meaning or purpose of slope?
- How can we connect it to candy?

**Assessment:**

**Formative:** Assessment (Data Test) in 5-7 days.

**Summative:** Demonstrate an understanding of the slope formula through homework and IXL

**Academic Language:** Slope, rate of change,  $(x_1, y_1)$ , rise over run, m

**Standard(s):**

- 2007 Mathematics 8.2.2.1, 8.2.2.4, 8.2.4.1

### Presentation/Syntax (Example given below...note the tiered portion in blue and red)

Elements	Minutes	Detailed Description
Consider: Work to prepare students and access prior knowledge and experiences	<b>5-10</b>	<b>Whole Group:</b> <b>1. Warm-up:</b> Students will use white boards and markers and attempt to perform the problem - Students will have 2 minutes to practice the problem - They will then take 5 minutes to discuss with teacher and think-pair-share with their tables

<p><b>Construct:</b> Work to allow students to build new knowledge and skills</p>	<p>15-25</p>	<p><b>Whole Group:</b></p> <p><b>2. Different elements of rate of change:</b> Explain to students that rate of change is equal to <math>m</math>, is equal to rise over run, is equal to change in <math>y</math>-values over change in <math>x</math>-values, is the slope.</p> <ul style="list-style-type: none"> <li>- Have students scribe notes labeled “Slope.” Show rate of change and the “train” that leads to slope. Show graphically, with a table, with a word problem, and with desks.</li> </ul> <p><b>3. Demonstrations:</b> Before students have the opportunity, teacher will show a problem on the board. To get on with class work, students must demonstrate how to find the slope of the problem and relate it in one or more ways.</p>
<p><b>Confirm:</b> Work to allow students to contrast new knowledge with prior and eventually come back with questions</p>	<p>25-35</p>	<p><b>4. Whole Group:</b> Students will work in their text books on problems that range from basic findings of slope to challenge and extend problems that require a multi-step process to find a solution.</p>

**Differentiation (Example given below)**

**Planned Support /Extension/ Differentiation for Specific Students:**

Students are allowed to work at different rates to accommodate their change (see what I did there?!) Students are placed at table groups of 4-5 and vary at different levels of academic skill. Teacher will re-teach individually or in small groups as needed. Only the high students will reach the challenge and extend section allowing them to explore in arbitrary numbers.

**Groups:**

See seating chart for more details (see what I did there?!)

The groups are differentiated by math levels to give a variety of ideas when working. This grade is a little higher in academic level so typically there are 2-3 high students with 2 medium-low students. The choice of thoroughness in the problem is the student’s alone. The “ready-to-go” students finish the whiteboard problem within 30 seconds whereas the “not-ready-yet” students may need more examples, individualized help and/or guided instruction which can take up to 10 minutes. Teacher may assign less problems to start with in order to ensure all aspects are covered. If middle-low students are able to complete those problems, then it is established that they try the other problems for more practice.

**Individual Student Accommodations:**

**Jimbob:**

- 10 minute sensory break at the end of class.
- Student uses task chair with that swivels to allow for slight movement
- Student has para Jen to help keep on task and help him advocate for help when needed.
- Student can wear his own personal headphones or sound eliminators during work times due to sensory hearing needs.
- Student implements expectations (point) sheet during and at the end of class to help promote on-task behavior.
